Important Disclaimer:

The work presented in this document was carried out in accordance with the Renzo Tonin & Associates Quality Assurance System, which is based on Australian Standard / NZS ISO 9001.

This document is issued subject to review and authorisation by the Team Leader noted by the initials printed in the last column above. If no initials appear, this document shall be considered as preliminary or draft only and no reliance shall be placed upon it other than for information to be verified later.

This document is prepared for the particular requirements of our Client referred to above in the 'Document details' which are based on a specific brief with limitations as agreed to with the Client. It is not intended for and should not be relied upon by a third party and no responsibility is undertaken to any third party without prior consent provided by Renzo Tonin & Associates. The information herein should not be reproduced, presented or reviewed except in full. Prior to passing on to a third party, the Client is to fully inform the third party of the specific brief and limitations associated with the commission.

In preparing this report, we have relied upon, and presumed accurate, any information (or confirmation of the absence thereof) provided by the Client and/or from other sources. Except as otherwise stated in the report, we have not attempted to verify the accuracy or completeness of any such information. If the information is subsequently determined to be false, inaccurate or incomplete then it is possible that our observations and conclusions as expressed in this report may change.

We have derived data in this report from information sourced from the Client (if any) and/or available in the public domain at the time or times outlined in this report. The passage of time, manifestation of latent conditions or impacts of future events may require further examination and re-evaluation of the data, findings, observations and conclusions expressed in this report.

We have prepared this report in accordance with the usual care and thoroughness of the consulting profession, for the sole purpose described above and by reference to applicable standards, guidelines, procedures and practices at the date of issue of this report. For the reasons outlined above, however, no other warranty or guarantee, whether expressed or implied, is made as to the data, observations and findings expressed in this report, to the extent permitted by law.

The information contained herein is for the purpose of acoustics only. No claims are made and no liability is accepted in respect of design and construction issues falling outside of the specialist field of acoustics engineering including and not limited to structural integrity, fire rating, architectural buildability and fit-for-purpose, waterproofing and the like. Supplementary professional advice should be sought in respect of these issues.

1 Introduction

Evolution Mining (Cowal) Pty Limited (Evolution) is the owner and operator of the Cowal Gold Operations (CGO), located approximately 38 kilometres (km) north-east of West Wyalong in New South Wales (NSW) (Figure 1). Renzo Tonin & Associates was engaged by Evolution to conduct an assessment examining the potential noise and blasting impacts of a proposed modification to the CGO (herein referred to as the Modification).

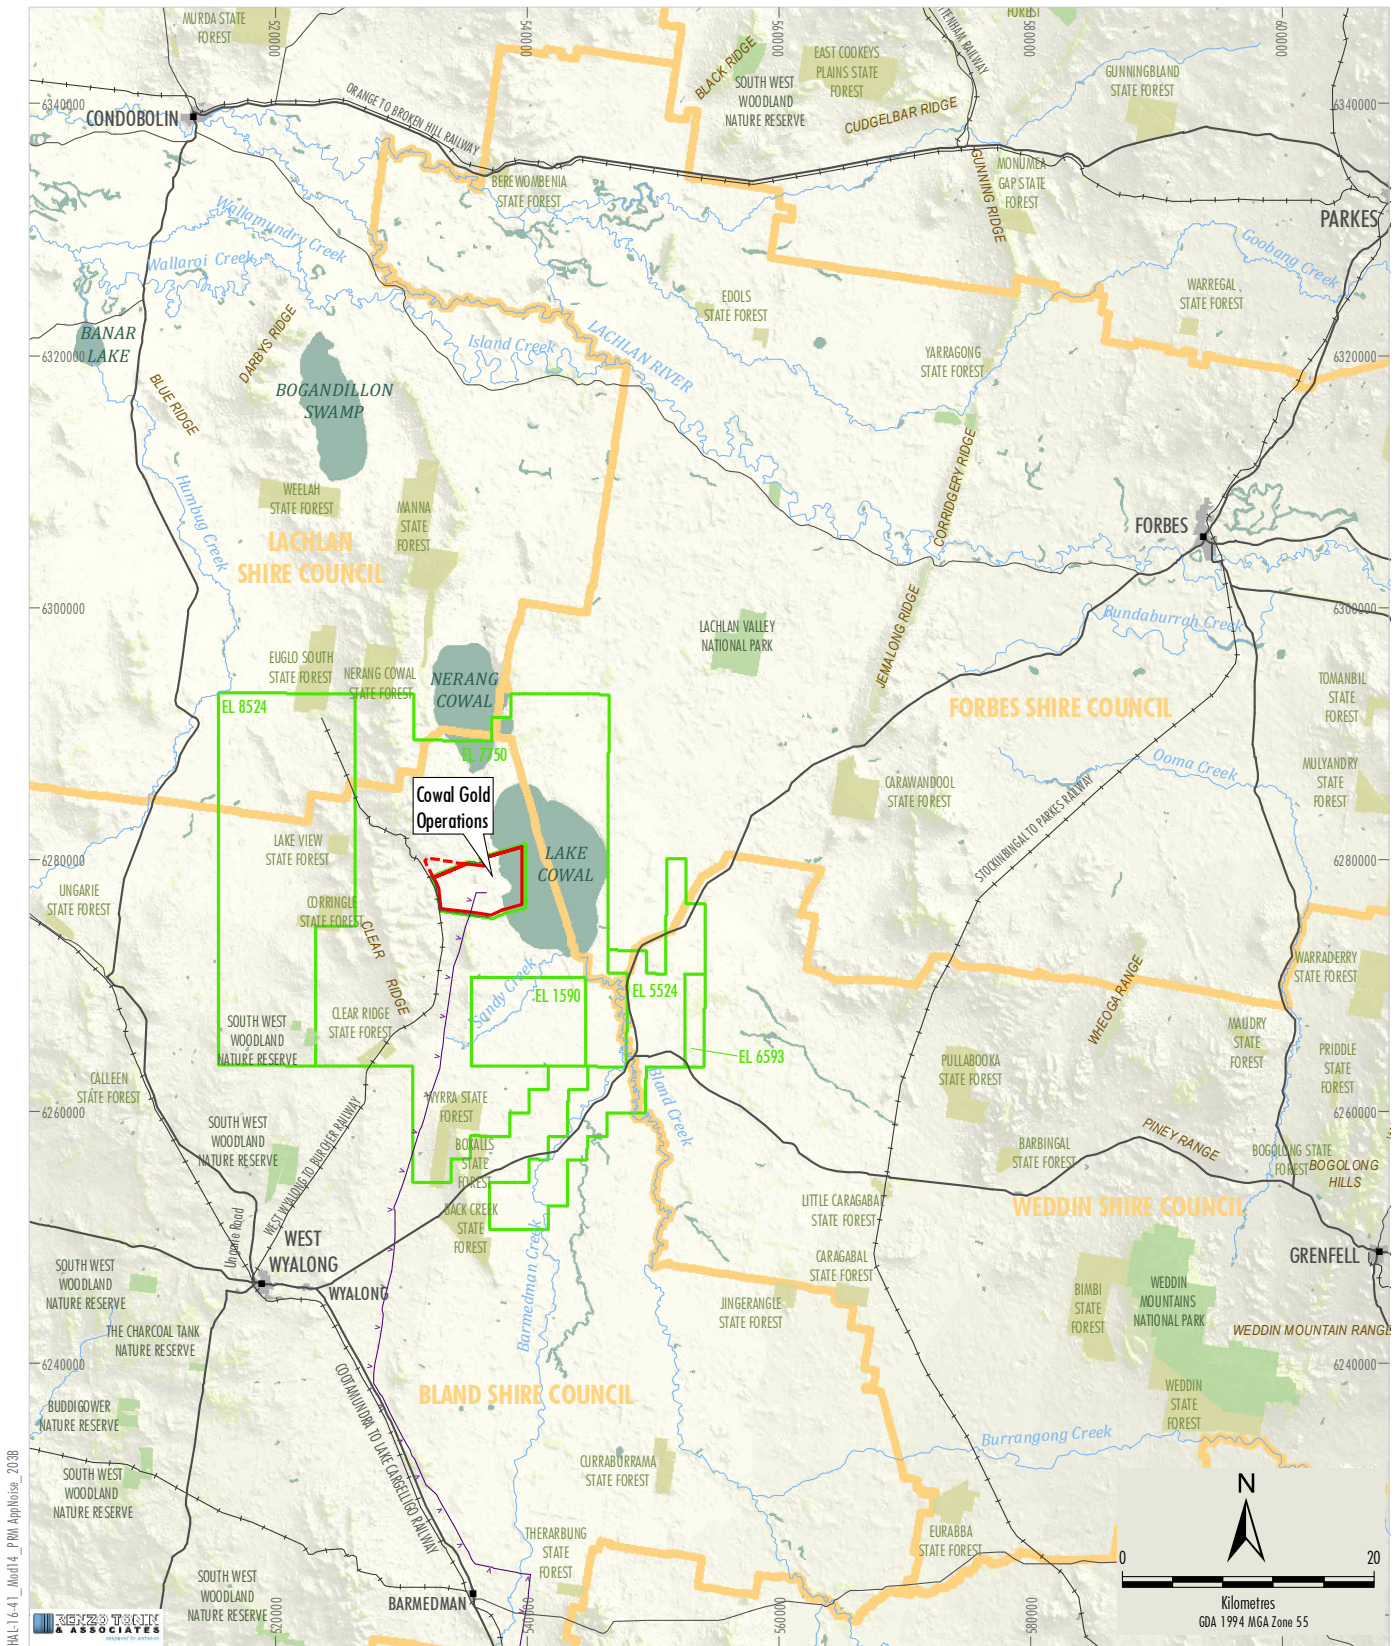

The issues addressed in this study include noise emissions from:

- operational activities;
- construction;
- blasting activities; and
- road traffic associated with the CGO.

The Secretary's Environmental Assessment Requirements (SEARs) for the Modification nominate the following specific noise issues to be addressed in this assessment (Table 1.1).

Table 1.1 – Location of the Addressed SEARs in this Document

CGO PROCESSING RATE MODIFICATION
Regional Location

Figure 1

Noise impacts are assessed following a number of policies, guidelines and standards, including:

- *NSW Industrial Noise Policy (INP)* (Environment Protection Authority [EPA], 2000)¹;
- *Voluntary Land Acquisition and Mitigation Policy – State Significant Development (SSD) Mining* (NSW Government, 2014);
- *Technical Basis for Guidelines to Minimise Annoyance Due to Blasting Overpressure and Ground Vibration* (ANZECC, 1990);
- *Interim Construction Noise Guideline (ICNG)* (Department of the Environment and Climate Change, 2009);
- *NSW Environmental Noise Control Manual* (EPA, 1994); and
- *NSW Road Noise Policy (RNP)* (Department of Environment, Climate Change and Water, 2011).

The work documented in this report was carried out in accordance with the Renzo Tonin & Associates Quality Assurance System, which is based on Australian Standard / NZS ISO 9001. Appendix A contains a glossary of acoustic terms used in this report.

It is noted that the Noise Policy for Industry (EPA, 2017) was released in October 2017. However, since the SEARs refer to the INP, this assessment has been conducted in accordance with the INP.

¹ It is noted that the NSW Noise Policy for Industry (EPA, 2017) was recently introduced to replace the INP. However for this assessment, noise impacts have been assessed in accordance to the INP as the SEARs refer to the use of the INP.

2 Modification Overview

Recent feasibility studies have identified potential opportunities to maximise the ore processing capacity of the CGO's existing process plant. On this basis, Evolution proposes to modify Development Consent DA 14/98 under section 75W of the NSW *Environmental Planning and Assessment Act, 1979* (EP&A Act) to increase the CGO's approved ore processing rate of 7.5 million tonnes per annum (Mtpa) to 9.8 Mtpa.

The main activities associated with development of the Modification would include (Figure 2):

- increasing the ore processing rate from 7.5 Mtpa to 9.8 Mtpa;
- modification of the existing Tailings Storage Facilities (TSFs) to form one larger TSF, which would also accommodate mine waste rock (herein referred to as the Integrated Waste Landform [IWL]);
- relocation of water management infrastructure (i.e. the Up-Catchment Diversion System and approved location for contained water storage D10) and other ancillary infrastructure (e.g. internal roads and soil and ore stockpiles) elsewhere within Mining Lease (ML) 1535 and Mining Lease Application (MLA) 1;
- installation of a secondary crushing circuit within the existing process plant area;
- duplication of the existing water supply pipeline across Lake Cowal;
- increased annual extraction of water from the CGO's external water supply sources;
- increased consumption of cyanide and other process consumables;
- an increase in the average and peak workforce employed at the CGO;
- relocation of a travelling stock reserve (TSR) and Lake Cowal Road; and
- provision of crushed rock material to local councils to assist with road base supplies.

3 Noise Receivers and Surrounding Land Uses

3.1 Land Use and Receiver Locations

Land use in the local area is predominantly agricultural operations. Properties surrounding the CGO are generally privately-owned or Evolution-owned, with some Crown Land.

The receiver locations considered in this assessment are listed in Table 3.1 and shown in Figure 3a. Landholders for the dwellings shown on Figure 3a are listed on Figure 3b.

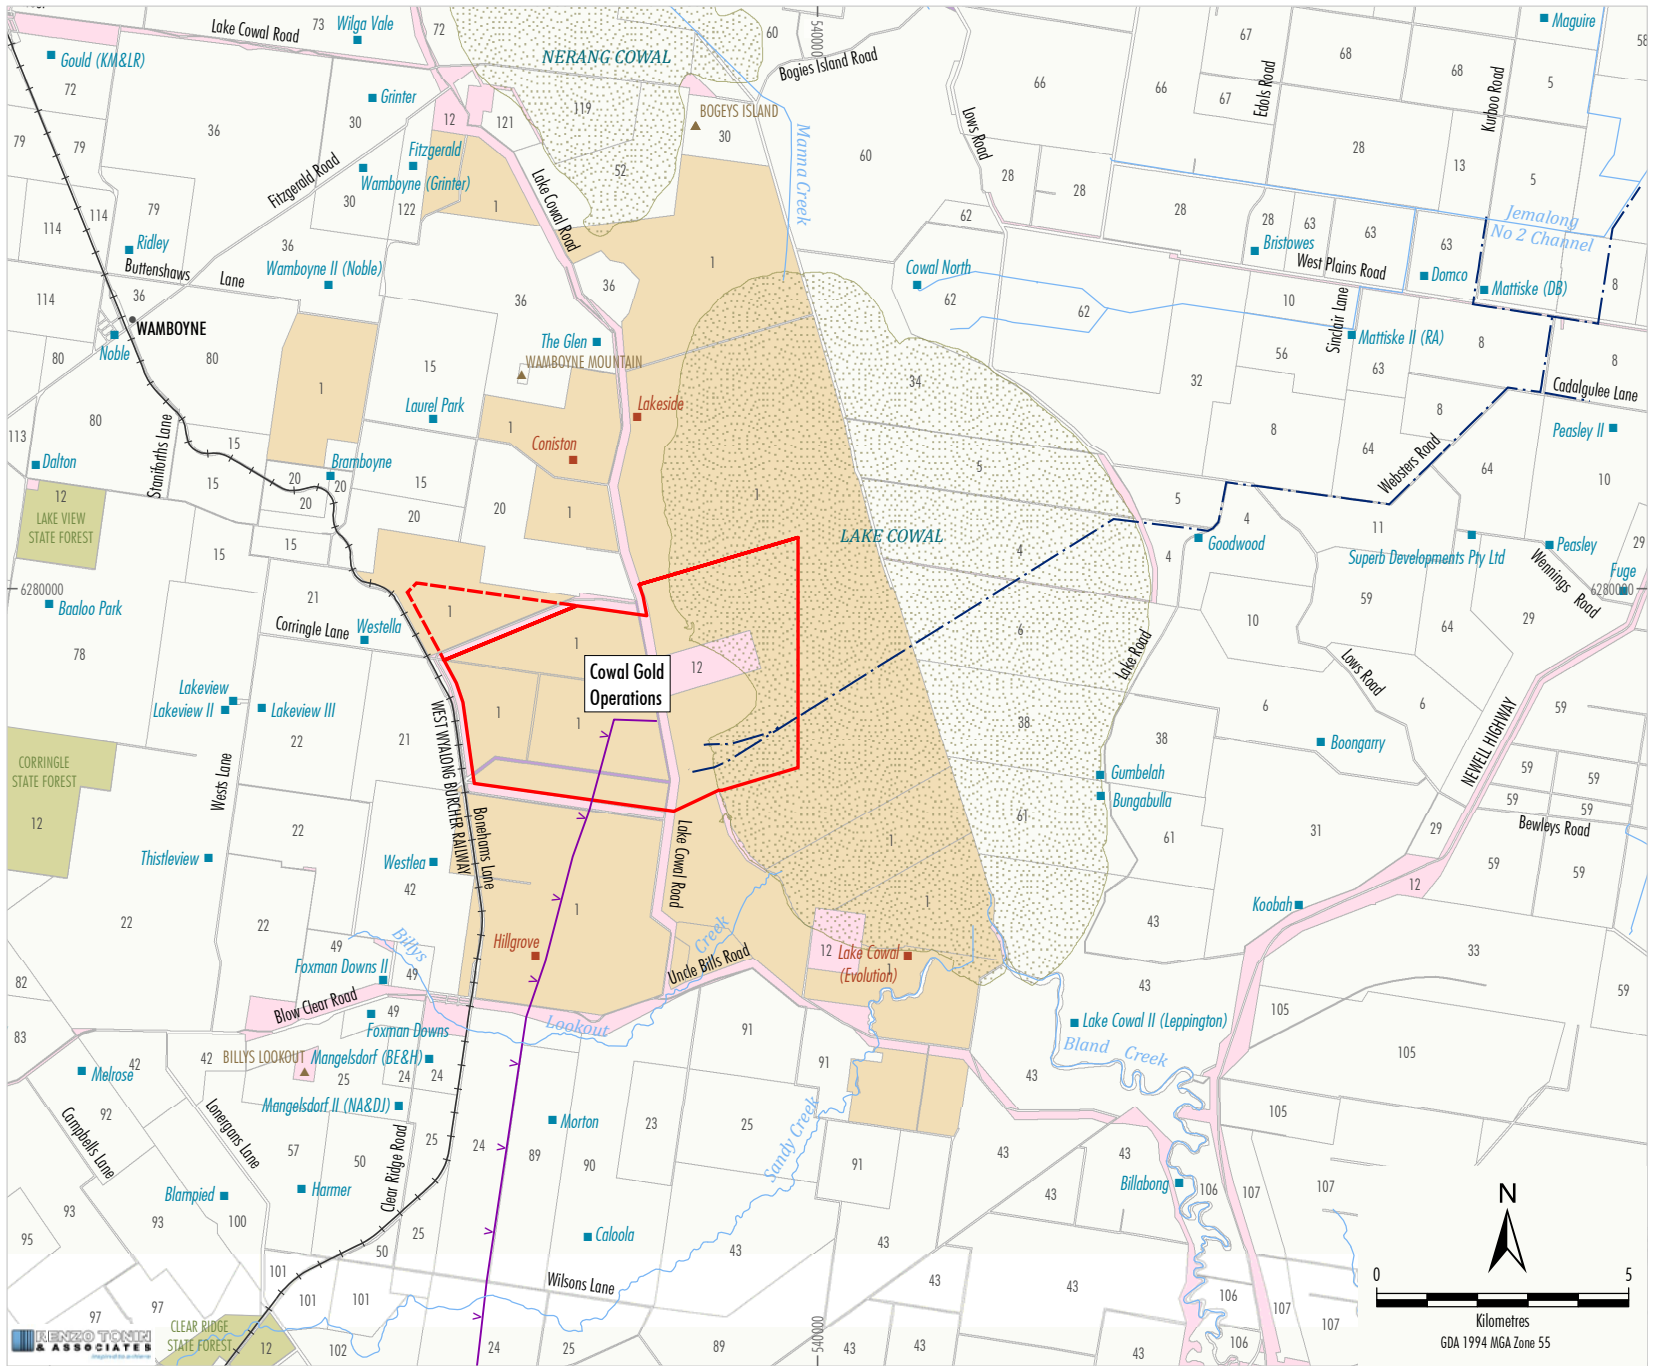

Two bird breeding areas and a Crown reserve have also been modelled for assessment purposes (Table 3.1).

| 122 | Fitzgerald | Privately-owned | 531978 | 6288396 |
| 126 | Noble | Privately-owned | 526050 | 6285038 |
| Other Modelled Receivers | | | | |
| Bird Breeding Area North (NO4) | Bird Breeding Area North (NO4) | Bird Breeding Area | 540025 | 6285561 |
| Bird Breeding Area South (NO3) | Bird Breeding Area South (NO3) | Bird Breeding Area | 539620 | 6281131 |
| Relocated Crown Reserve | Relocated Crown Reserve | Lake Cowal | 539978 | 6273640 |

- Notes:
1. These dwellings were previously known as 'Foxham Downs' and Foxham Downs II'.
 2. It is noted that following investigation, no dwelling appears to be present at the location of the previously identified receiver known as 'Caloola II' or dwelling ID 90b. The owner of the property has confirmed that no habitable building is present. The dwelling ID for the receiver known as 'Caloola' has therefore changed from 90a to 90.

Figure 3b

4 Existing Acoustic Environment

Appendix B of the NSW EPA's INP outlines two methods for determining the background noise level of an area, being 'B1 – Long-term background noise method' and 'B2 – Short-term background noise method'.

As the noise environment of an area almost always varies over time, background and ambient noise levels need to be determined for the operational times of the proposed development. For example, in a suburban or urban area the noise environment is typically at its minimum at 3:00 am in the morning and at its maximum during the morning and afternoon traffic peak hours. The INP outlines the following standard time periods over which the background and ambient noise levels are to be determined:

- Day: 7:00 am - 6:00 pm Monday to Saturday and 8:00 am - 6:00 pm Sundays & Public Holidays.
- Evening: 6:00 pm - 10:00 pm Monday to Sunday & Public Holidays.
- Night: 10:00 pm - 7:00 am Monday to Saturday and 10:00 pm - 8:00 am Sundays & Public Holidays.

Criteria for the assessment of operational noise are usually derived from the existing noise environment of an area, excluding noise from the subject development. Long-term background noise surveys to characterise the existing acoustic environment in the area surrounding ML 1535 (Figure 1) were undertaken in July and December 1994 prior to the operation of the CGO. Additional background noise monitoring was not considered appropriate for the Modification given the existing operation of the approved CGO. The Rating Background Levels (RBL) and representative ambient L_{eq} noise levels for each assessment period were previously presented in the Modification 13 Noise and Blasting Impact Assessment (Renzo Tonin & Associates, 2016) and have been utilised in this assessment.

4.1 Background Noise Measurement Results

Table 4.1 presents the overall single RBL and representative ambient L_{eq} noise levels for each assessment period, determined in accordance with the INP, as presented in the Modification 13 Noise and Blasting Impact Assessment (Renzo Tonin & Associates, 2016). It is noted that the RBLs determined are the minimum that can be obtained in accordance with the INP, and will therefore provide a conservative assessment.

Table 4.1 – Noise Monitoring Results, A-weighted decibels (dB[A])

| Receiver Location | L _{A90} RBL | | | L _{Aeq} Ambient noise levels ⁴ | | |
|-------------------|----------------------|----------------------|--------------------|--|----------------------|--------------------|
| | Day ¹ | Evening ² | Night ³ | Day ¹ | Evening ² | Night ³ |
| Privately-owned | 30 | 30 | 30 | <44 | <39 | <34 |

- Notes:
1. Day: 7:00 am - 6:00 pm Monday to Saturday and 8:00 am - 6:00 pm Sundays & Public Holidays.
 2. Evening: 6:00 pm - 10:00 pm Monday to Sunday & Public Holidays.
 3. Night: 10:00 pm - 7:00 am Monday to Saturday and 10:00 pm - 8:00 am Sundays & Public Holidays.
 4. As required by the INP, the external ambient noise levels presented are free-field noise levels (ie. no façade reflection is incorporated).

4.2 Ongoing Noise Monitoring

The Noise Management Plan (Barrick, 2010) prepared to satisfy the requirements of Development Consent (DA 14/98) following approval of Modification 10 included noise monitoring on a half-yearly basis, and was implemented until March 2015. The revised Noise Management Plan (Evolution, 2014) prepared to satisfy Development Consent DA 14/98 following approval of Modification 11, and approved by the NSW Department of Planning and Environment (DP&E) on 5 March 2015, was then implemented for the CGO. The revised Noise Management Plan includes quarterly noise monitoring.

For the period January 2013 to September 2017, operational noise surveys demonstrated that the CGO is operating in compliance with the noise assessment criteria imposed in Development Consent DA 14/98 and Environment Protection Licence 11912 conditions. During the period, operator attended noise monitoring results showed no exceedance of the noise impact assessment criteria.

4.3 Noise Complaints Record

One noise-related complaint was received by the CGO from January 2015 to January 2018, in November 2015. An investigation undertaken in response to the noise-related complaint indicated that the CGO was operating in accordance with the relevant Development Consent DA 14/98 noise limits. Further information regarding complaints received in each year and their resolution are described in the Annual Review.

5 Meteorology

Certain meteorological conditions may increase noise levels by focusing sound-wave propagation paths at a single point. Such refraction of sound waves occur during temperature inversions (atmospheric conditions where temperatures increase with height above ground level) and where there is a wind gradient (that is, wind velocities increasing with height) with wind direction from the source to the receiver.

Temperature inversions occurring within the lowest 50 metres (m) to 100 m of atmosphere can affect noise levels measured on the ground. Temperature inversions are most commonly caused by radiative cooling of the ground at night leading to the cooling of the air in contact with the ground. This is especially prevalent on cloudless nights with little wind. Air that is somewhat removed from contact with the ground will not cool as much, resulting in warmer air aloft than nearer the ground.

Similarly, when significant wind exists, the conditions can materially affect noise levels at receptor points downwind of a noise source. This would depend, however, on the particular direction and the velocity of the wind at that time. It should also be noted that although wind can raise noise emission levels as perceived from a downstream assessment point, background noise also tends to increase as a result of increased wind activity. This often causes masking of potential increases in intrusive noise.

The NSW EPA's INP recommends that project noise criteria are to apply under weather conditions characteristic of an area. These conditions may include calm, wind and temperature inversions. In this regard, the increase in noise that results from atmospheric temperature inversions and wind effects may need to be assessed. The noise levels predicted under characteristic meteorological conditions for each receiver are then compared with the criteria, to establish whether the meteorological effect will cause a significant impact.

The NSW EPA's INP permits two approaches for assessing these effects: use of default parameters and use of site-specific parameters:

- With using default parameters, general meteorological values are used to predict noise levels, foregoing detailed analysis of site-specific meteorological data. This approach assumes that meteorological effects are conservative, in that it is likely to predict the upper range of increases in noise levels. Actual noise levels may be less than predicted.
- The use of site-specific parameters is a more detailed approach, which involves analysing site meteorological data to determine whether inversion and/or wind effects are significant features warranting assessment. Where assessment is warranted, default parameters are available for use in predicting noise or, where preferred, measured values may be used instead. The use of site-specific parameters provides a more accurate prediction of noise increases due to meteorological factors, however, is more costly especially if suitable site data is unavailable and long-term meteorological monitoring is required. Existing weather data may be used, provided the site is within a radius of 30 km of the collection point and in the same topographical basin.

The more detailed approach using site-specific meteorological parameters was conducted previously in the Modification 11 Noise and Blasting Impact Assessment (SLR Consulting, 2013) and subsequently in the Modification 13 Noise and Blasting Impact Assessment (Renzo Tonin & Associates, 2016). Wind enhancement was not found to be a feature of the area but temperature inversions are a feature. To provide a comparative assessment to the modelling conducted for Modifications 11 and 13, the meteorological analysis from those studies have been adopted for the Modification. As such, temperature inversions are included in the operational noise computer modelling.

5.1 Summary of Meteorological Assessment Conditions

Table 5.1 presents a summary of the meteorological conditions considered for the operational noise computer modelling in Modifications 11 and 13, as well as for this assessment.

Table 5.1 – Summary of Meteorological Assessment Conditions

| Period | Meteorological Assessment Condition | Air Temperature | Relative Humidity | Wind Velocity ¹ | Temperature Gradient |
|--|-------------------------------------|-----------------|-------------------|----------------------------|----------------------|
| Day (8:30 am to 5:00 pm) | Calm | 12°C | 64% | 0 m/s | 0°C/100 m |
| Late Afternoon (5:00 pm to 6:00 pm) and Early Morning (7:00 am to 8:30 am) | Moderate Inversion | 12°C | 64% | 0 m/s | 3°C/100 m |
| Evening (6:00 pm to 10:00 pm) | Strong Inversion | 10°C | 70% | 0 m/s | 8°C/100 m |
| Night (10:00 pm to 7:00 am) | Strong Inversion | 8°C | 80% | 0 m/s | 8°C/100 m |

Notes: 1. Local topography is generally flat and drainage flows are not considered a feature of the area.
°C = degrees Celsius; m/s = metres per second; °C/100 m = degrees Celsius per 100 metres.

6 Applicable Noise Criteria

6.1 Construction Noise

The ICNG provides guidelines for assessing noise generated during the construction phase of developments.

The key components of the guideline that are incorporated into this assessment include:

- Use of L_{Aeq} as the descriptor for measuring and assessing construction noise.
- Application of reasonable and feasible noise mitigation measures.
- As stated in the ICNG, a noise mitigation measure is feasible if it is capable of being put into practice, and is practical to build given the project constraints.
- Selecting reasonable mitigation measures from those that are feasible involves making a judgement to determine whether the overall noise benefit outweighs the overall social, economic and environmental effects.

The ICNG provides two methods for assessment of construction noise, being either a quantitative or a qualitative assessment. A quantitative assessment is recommended for major construction projects of significant duration, and involves the measurement and prediction of noise levels, and assessment against set criteria. A qualitative assessment is recommended for small projects with a duration of less than three weeks and focuses on minimising noise disturbance through the implementation of reasonable and feasible work practices, and community notification.

Given the scale and duration of the construction works proposed for the Modification, a quantitative assessment is carried out herein, consistent with the ICNG.

Table 6.1, reproduced from the ICNG, sets out the Noise Management Levels (NMLs) and how they are to be applied for residential receivers.

Table 6.1 – Noise Management Levels at Residential Receivers

| Time of Day | Management Level | How to Apply |
|---|-----------------------------------|---|
| | L _{Aeq} (15 min) | |
| Recommended standard hours: Monday to Friday 7 am to 6 pm Saturday 8 am to 1 pm No work on Sundays or public holidays | Noise affected RBL + 10 dB(A) | The noise affected level represents the point above which there may be some community reaction to noise. Where the predicted or measured L _{Aeq} (15 min) is greater than the noise affected level, the proponent should apply all feasible and reasonable work practices to meet the noise affected level. The proponent should also inform all potentially impacted residents of the nature of works to be carried out, the expected noise levels and duration, as well as contact details. |
| | Highly noise affected 75 dB(A) | The highly noise affected level represents the point above which there may be strong community reaction to noise. Where noise is above this level, the relevant authority (consent, determining or regulatory) may require respite periods by restricting the hours that the very noisy activities can occur, taking into account: <ul style="list-style-type: none"> • times identified by the community when they are less sensitive to noise (such as before and after school for works near schools, or mid-morning or mid-afternoon for works near residences) • if the community is prepared to accept a longer period of construction in exchange for restrictions on construction times. |
| Outside recommended standard hours | Noise affected RBL + 5 dB(A) | A strong justification would typically be required for works outside the recommended standard hours. The proponent should apply all feasible and reasonable work practices to meet the noise affected level. Where all feasible and reasonable practices have been applied and noise is more than 5 dB(A) above the noise affected level, the proponent should negotiate with the community. For guidance on negotiating agreements see section 7.2.2 of the ICNG. |

After: ICNG (Department of the Environment and Climate Change, 2009).

The construction activities relevant to the Modification and their proposed construction hours are below:

- Lake Cowal Road relocation – recommended standard construction hours only.
- Pipeline duplication – recommended standard construction hours except where construction is undertaken on the western side of Lake Cowal (adjacent to CGO operations which are conducted 24 hours per day).

Based on the above ICNG requirements and applicable construction hours, Table 6.2 presents the construction NMLs established for the nearest noise sensitive residential receivers based upon the noise monitoring outlined in Section 4.1.

Table 6.2 – Construction Noise Management Levels at Residential Receivers

| Receiver Location | L _{A90} RBL ¹ , dB(A) | | | NML L _{Aeq} (15min), dB(A) | | |
|---------------------------|---|---------|-------|-------------------------------------|---------|-------|
| | Day | Evening | Night | Day | Evening | Night |
| All Residential Receivers | 30 | 30 | 30 | 40 | 35 | 35 |

Notes: 1. RBLs have adopted the minimum background noise levels nominated in the INP as long-term background noise levels. The noise levels were recorded at approximately 30 dB(A) and below (refer to Section 4.1).

6.2 Operational Noise

Operational noise from the Modification is assessed in accordance with the INP. The INP is used as a guide by the EPA for setting statutory limits in licences for scheduled noise sources.

The INP has two components:

- Controlling intrusive noise impacts in the short term for residences.
- Maintaining noise level amenity for particular land uses for residences and other land uses.

6.2.1 Intrusive Noise Impacts

According to the INP, the intrusiveness of a noise source may generally be considered acceptable if the equivalent continuous (energy-average) A-weighted level of noise from the source (represented by the L_{Aeq} descriptor) does not exceed the background noise level measured in the absence of the source by more than 5 dB(A). The intrusiveness criterion is only applicable to residential type receivers and is summarised as follows:

- $L_{Aeq,15minute} \leq \text{RBL plus 5 dB(A)}$

Table 6.3 presents the intrusiveness criteria established for the nearest noise sensitive residential receivers based upon the noise monitoring outlined in Section 4.1.

Table 6.3 – Intrusiveness Criteria

| Receiver Location | RBL, dB(A) | | | Intrusiveness Criteria $L_{Aeq\ 15minute}$, dB(A) | | |
|---------------------------|------------|---------|-------|---|---------|-------|
| | Day | Evening | Night | Day | Evening | Night |
| All Residential Receivers | 30 | 30 | 30 | 35 | 35 | 35 |

Notes: RBLs have adopted the minimum background noise levels nominated in the INP as long term background noise levels. The noise levels were recorded at approximately 30 dB(A) and below (refer to Section 4.2 of the INP).

6.2.2 Protecting Noise Amenity

The amenity criteria are determined in accordance with Chapter 2 of the INP. The INP recommends base acceptable noise levels for various receivers, including residential, commercial, industrial and sensitive receivers such as schools, hospitals, churches and parks. These base noise criteria are then lowered by up to 10 dB depending on the extent of existing industrial noise impact upon the receiver (if applicable). Higher levels of existing industrial noise therefore result in stricter amenity criteria applied to any new industrial development. In this way the cumulative impacts of existing and known future industrial noise sources are minimised.

To limit continuing increases in noise levels, the maximum ambient noise level within an area from industrial noise sources should not normally exceed the acceptable noise levels specified in Table 2.1 of the policy, the applicable parts of which are reproduced in Table 6.4 below.

It is noted that as a general rule, building structures would typically provide a minimum of 10 dB(A) reduction from external noise levels to internal noise levels, with windows opened sufficiently for fresh air ventilation.

Table 6.4 – Amenity Criteria – Recommended L_{Aeq} Noise Levels from Industrial Sources

| Type of Receiver | Indicative Noise Amenity Area | Time of Day ^{1, 2} | Recommended $L_{Aeq, Period}$ ³ Noise Level, dB(A) | |
|--|-------------------------------|---------------------------------------|---|---------------------|
| | | | Acceptable | Recommended Maximum |
| Residence | Rural | Day | 50 | 55 |
| | | Evening | 45 | 50 |
| | | Night | 40 | 45 |
| School classrooms – internal | All | Noisiest 1 hour period when in use | 35 | 40 |
| Hospital ward - internal - external | All | Noisiest 1 hour period | 35 | 40 |
| | | | 50 | 55 |
| Place of worship – internal | All | When in use | 40 | 45 |
| Area specifically reserved for passive recreation (e.g. National Park) | All | When in use | 50 | 55 |
| Active recreation area (e.g. school playground, golf course) | All | When in use | 55 | 60 |
| Commercial premises | All | When in use | 65 | 70 |
| Industrial premises | All | When in use | 70 | 75 |

- Notes:
1. Daytime 7.00 am - 6.00 pm; Evening 6.00 pm - 10.00 pm; Night-time 10.00 pm - 7.00 am.
 2. On Sundays and Public Holidays, Daytime 8.00 am - 6.00 pm; Evening 6.00 pm - 10.00 pm; Night-time 10.00 pm - 8.00 am.
 3. The L_{Aeq} index corresponds to the level of noise equivalent to the energy average of noise levels occurring over a measurement period.

6.2.3 Noise Impact Assessment Criteria

The existing CGO Development Consent (DA 14/98) (as modified) contains noise impact assessment criteria. The extract presented below from Condition 6.4, Schedule 2 of DA 14/98, includes the relevant conditions regarding Acquisition Upon Request and Noise Impact Assessment Criteria:

a) *Acquisition Upon Request*

Upon receiving a written request for acquisition from the owner of any land listed in Table 7, the Applicant shall acquire the land in accordance with the procedures in condition 8.3.

Table 7: Land subject to acquisition upon request

| |
|-----------------|
| <i>Westella</i> |
| <i>Westlea</i> |

b) *Additional Noise Mitigation*

Upon receiving a written request from the owner of the residents listed in Tables 7 and 7A, the Applicant shall implement additional noise mitigation measures (such as double-glazing, insulation, and/or air conditioning) at the residence in consultation with the landowner. These measures must be reasonable and feasible, and directed towards reducing the noise impacts of the development on the residence.

If within 3 months of receiving this request from the owner, the Applicant and the owner cannot agree on the measures to be implemented, or there is a dispute about the implementation of these measures, then either party may refer the matter to the Secretary for resolution.

Table 7A: Land subject to mitigation upon request

| |
|---------------------|
| <i>Laurel Park</i> |
| <i>Lakeview III</i> |
| <i>Bramboyne</i> |
| <i>The Glen</i> |
| <i>Caloola II</i> |

c) *Noise Impact Assessment Criteria*

The Applicant shall ensure that the noise generated by the development does not exceed the noise impact assessment criteria in Table 8 at any residence on privately-owned land.

Table 8: Noise Impact Assessment Criteria dB(A) $L_{Aeq(15min)}$

| <i>Land</i> | <i>Day/Evening/Night</i> |
|---|--------------------------|
| <i>Laurel Park, Lakeview III</i> | <i>39</i> |
| <i>Bramboyne, The Glen, Caloola II</i> | <i>38</i> |
| <i>Lakeview, Lakeview II, Foxham Downs II</i> | <i>37</i> |
| <i>All other privately-owned land</i> | <i>35</i> |

It is noted that the 'Foxham Downs II' receiver is now known as 'Foxman Downs II'.

6.2.4 Project Specific Noise Levels

In accordance with the INP, noise impacts should be assessed in terms of both intrusiveness and amenity. Based on the background and ambient noise monitoring carried out at the nearest affected receiver locations, the Project Specific Noise Levels (PSNLs) are outlined in Table 6.5 below.

Table 6.5 – Project Specific Noise Levels

| Locality | Land Use | Intrusiveness, $L_{Aeq,15min}$, dB(A) ¹ | | | Amenity, $L_{Aeq,Period}$, dB(A) ¹ | | |
|-------------------------|--------------------------------|---|---------|-------|--|---------|-------|
| | | Day | Evening | Night | Day | Evening | Night |
| Privately-owned Land | Rural Residential ² | 35 | 35 | 35 | 50 | 45 | 40 |
| Relocated Crown Reserve | Passive Recreation | - | - | - | 50 (when in use) | | |

Notes: 1. RBLs have adopted the minimum background noise levels nominated in the INP as long term background noise levels were recorded at approximately 30dB(A) and below.
2. Residential locations have been categorised as 'Rural'.

6.2.5 Voluntary Land Acquisition and Mitigation Policy

The INP states that the intrusiveness and amenity criteria have been selected to protect at least 90% of the population living in the vicinity of industrial noise sources from the adverse effects of noise for at least 90% of the time. Provided the criteria in the INP are achieved, then it is unlikely that most people would consider the resultant noise levels excessive.

In those cases when the PSNLs are not, or cannot be, achieved, then it does not automatically follow that those people affected by the noise would find the noise unacceptable. In subjective terms, exceedances of the PSNLs are described in the NSW Government's *Voluntary Land Acquisition and Mitigation Policy – SSD Mining* and reproduced in Table 6.6 below.

Table 6.6 – Characterisation of Noise Impacts & Potential Treatments

| Residual Noise Exceeds INP Criteria By | Characterisation of Impacts | Potential Treatment |
|--|---|--|
| 0-2 dB(A) above the PSNL | Impacts are considered to be negligible | The exceedances would not be discernible by the average listener and therefore would not warrant receiver based treatments or controls. |
| 3-5 dB(A) above the PSNL in the INP <u>but</u> the development would contribute less than 1 dB to the total industrial noise level | Impacts are considered to be marginal | Provide mechanical ventilation/comfort condition systems to enable windows to be closed without compromising internal air quality/amenity. |
| 3-5 dB(A) above the PSNL in the INP <u>and</u> the development would contribute more than 1 dB to the total industrial noise level | Impacts are considered to be moderate | As for marginal impacts but also upgraded façade elements like windows, doors, roof insulation etc. to further increase the ability of the building façade to reduce noise levels. |
| >5 dB(A) above the PSNL in the INP | Impacts are considered to be significant | Provide mitigation as for moderate impacts and see voluntary land acquisition provisions below. |

Furthermore, the policy also presents information regarding the requirements for voluntary mitigation and voluntary acquisition. A consent authority can apply voluntary mitigation and voluntary land acquisition rights to reduce:

- *Operational noise impacts of a development on privately owned land; and*
- *Rail noise impacts of a development on privately owned land near non-network rail lines (private rail lines), on or exclusively servicing industrial sites (see Appendix 3 of the RING);*

But not:

- *Construction noise impacts, as these impacts are shorter term and can be controlled;*
- *Noise impacts on the public road or rail network; or*
- *Modifications of existing developments with legacy noise issues, where the modification would have beneficial or negligible noise impacts. In such cases, these legacy noise issues should be addressed through site-specific pollution reduction programs under the Protection of the Environment Operations Act 1997.*

Voluntary Mitigation Rights

A consent authority should only grant voluntary mitigation rights where, even with the implementation of best practice management:

- *The noise generated by the development would be equal to or greater than 3 dB(A) above the INP project-specific noise level at any residence on privately-owned land; or*
- *The development would increase the total industrial noise level at any residence on privately-owned land by more than 1 dB(A), and noise levels at the residence are already above the recommended amenity criteria in Table 2.1 of the INP; or*
- *The development includes a private rail line and the use of that private rail line would cause exceedances of the recommended acceptable levels in Table 6 of Appendix 3 of the RING (see Appendix B) by greater than or equal to 3 dB(A) at any residence on privately-owned land.*

All noise levels must be calculated in accordance with the INP or Rail Infrastructure Noise Guideline (RING) (as applicable).

The selection of mitigation measures should be guided by the potential treatments identified in those cases when the PSNLs are not, or cannot be, achieved as per Table 6.6 above.

Voluntary Land Acquisition Rights

A consent authority should only grant voluntary land acquisition rights where, even with the implementation of best practice management:

- *The noise generated by the development would be more than 5 dB(A) above the Project specific noise level at any residence on privately-owned land; or*

- *The noise generated by the development would contribute to exceedances of the recommended maximum noise levels in Table 2.1 of the INP on more than 25% of any privately-owned land where there is an existing dwelling or where, a dwelling could be built under existing planning controls; or*
- *The development includes a private rail line and the use of that private rail line would cause exceedances of the recommended maximum criteria in Table 6 of Appendix 3 of the RING at any residence on privately-owned land.*

All noise levels must be calculated in accordance with the INP or RING (as applicable).

An amended draft Voluntary Land Acquisition and Mitigation Policy was released in December 2017. As the amendments are in draft at the time of writing, they are not considered further in this assessment.

6.2.6 Cumulative Noise Levels

For cumulative noise levels, the INP amenity criteria is applicable as it is intended to control the total noise level at a receiver location from all industrial or mining developments. The cumulative noise levels are therefore assessed against the amenity criteria nominated in Table 6.4. However, there are currently no industrial or other mining developments in the vicinity of the Modification which would impact the identified receiver locations. Accordingly, potential cumulative noise impacts are not considered further.

6.2.7 Sleep Disturbance

Noise emanating from the Modification has been assessed for its potential to disturb sleep. The NSW EPA (2013) has made the following policy statement with respect to sleep disturbance:

Peak noise level events, such as reversing beepers, noise from heavy items being dropped or other high noise level events, have the potential to cause sleep disturbance. The potential for high noise level events at night and effects on sleep should be addressed in noise assessments for both the construction and operational phases of a development. The INP does not specifically address sleep disturbance from high noise level events.

Research on sleep disturbance is reviewed in the NSW Road Noise Policy. This review concluded that the range of results is sufficiently diverse that it was not reasonable to issue new noise criteria for sleep disturbance.

From the research, the EPA recognised that current sleep disturbance criterion of an $L_{A1, (1 \text{ minute})}$ not exceeding the $L_{A90, (15 \text{ minute})}$ by more than 15 dB(A) is not ideal. Nevertheless, as there is insufficient evidence to determine what should replace it, the EPA will continue to use it as a guide to identify the likelihood of sleep disturbance. This means that where the criterion is met, sleep disturbance is not likely, but where it is not met, a more detailed analysis is required.

The detailed analysis should cover the maximum noise level or $L_{A1, (1 \text{ minute})}$, that is, the extent to which the maximum noise level exceeds the background level and the number of times this happens during the night-time period. Some guidance on possible impact is contained in the review of research results in the appendices to the NSW Road Noise Policy. Other factors that may be important in assessing the extent of impacts on sleep include:

- how often high noise events will occur.
- time of day (normally between 10 pm and 7 am).
- whether there are times of day when there is a clear change in the noise environment (such as during early morning shoulder periods).

The $L_{A1, (1 \text{ minute})}$ descriptor is meant to represent a maximum noise level measured under 'fast' time response. EPA will accept analysis based on either $L_{A1, (1 \text{ minute})}$ or $L_{A, (Max)}$.

The policy states that a sleep disturbance criterion of $L_{A1,1\text{minute}} \leq L_{A90,15\text{minute}} + 15 \text{ dB(A)}$ should be used as a first step 'guide' as it is 'not ideal' and 'where it is not met, a more detailed analysis is required'. That detailed analysis includes a reference to research material contained in the RNP.

The RNP contains a summary of the findings of world-wide research undertaken on sleep disturbance from noise up until the time when this publication was produced. It summarises all of the research with the following statement:

From the research on sleep disturbance to date it can be concluded that:

- maximum internal noise levels below 50-55 dB(A) are unlikely to awaken people from sleep; and
- one or two noise events per night, with maximum internal noise levels of 65-70 dB(A), are not likely to affect health and wellbeing significantly.

Therefore, from the above research a 50-55 dB(A) maximum internal noise level would be equivalent to approximately 65-70 dB(A) maximum noise level outside a bedroom window. These external noise limits are in line with the noise limits described by Griefahn [Acoustics Australia vol 20 No 2 August 1992 pp 43-47] and the RNP which address sleep disturbance.

In summary, the sleep disturbance criteria described in policies above are used for the purpose of noise impact assessment for this study, however due consideration is also given to the RNP research findings in setting an appropriate 'upper' limit.

The sleep disturbance criteria are summarised in Table 6.7 below.

Table 6.7 – Sleep Disturbance Criteria

| Receiver | Sleep disturbance criteria, 10:00 pm - 7:00 am, $L_{A1,1\text{minute}}$ | |
|-----------------|---|-------------|
| | $L_{A90,15\text{minute}} + 15$ | Upper limit |
| All residential | $30 + 15 = 45 \text{ dB(A)}$ | 65 dB(A) |

7 Construction Noise Assessment

7.1 Construction Noise Modelling Scenario

The Modification would include two distinct construction activities:

- duplication of a water pipeline to the eastern side of Lake Cowal; and
- realignment of Lake Cowal Road.

Construction of the IWL would occur in conjunction with mining operations, therefore is assessed as operational noise in Section 8.

7.2 Construction Noise Sources

The Sound Power Levels (SWLs) of plant likely to be used during the construction activities have been determined based on manufacturer's specifications, or other available information including Renzo Tonin & Associates' database of noise levels and previous studies.

Modifying factor adjustments, as per Section 4 of the INP, has been considered for all proposed plant and equipment. Based on Renzo Tonin & Associates' experience, noise from all proposed plant and equipment, individually and in combination were determined not to exhibit tonal, low-frequency, impulsive, and/or intermittent characteristics. Therefore, no modifying factors corrections are required.

A summary of plant and equipment included in the noise modelling for the construction scenarios, and relevant SWLs, is provided in Table 7.1.

Table 7.1 – Indicative Construction Plant and Equipment Fleet List and SWLs

| Plant Item | Specification | SWLs, dB(A) re. 1pW (per Item) | Number of Items |
|-----------------------------|---------------|-----------------------------------|-----------------|
| Pipeline Duplication | | | |
| Compactor | - | 110 | 2 |
| Excavator | 30 t | 110 | 4 |
| Manitou / Telehandler | - | 110 | 2 |
| Water Cart | - | 110 | 1 |
| Dozer | D6 | 109 | 1 |
| Fuel / Service Truck | - | 108 | 1 |
| Generator | - | 100 | 3 |
| Lighting Plant | - | 100 | 2 |
| Light Vehicle | - | 100 | 4 |
| Franna Crane | - | 99 | 1 |
| Road Relocation | | | |
| Scraper | - | 110 | 1 |

| Plant Item | Specification | SWLs, dB(A) re. 1pW (per Item) | Number of Items |
|--------------------|---------------|--------------------------------|-----------------|
| Dozer | D8 or D9 | 109 | 1 |
| Padfoot Roller | - | 109 | 2 |
| Smooth Drum Roller | - | 109 | 1 |
| Excavator | 30 t | 110 | 1 |
| Grader | - | 107 | 1 |
| Semi Water Cart | - | 104 | 2 |
| Tipper | - | 101 | 3 |

Note: t = tonnes; 1pW = one picoWatt.

7.3 Construction Hours

The proposed construction works will be undertaken during standard construction hours, except for construction of the pipeline duplication on the western side of Lake Cowal, adjacent to the CGO. Given the proximity to the CGO and significant distance to sensitive receivers, construction of this portion of the pipeline would be 24 hours, 7 days per week. The recommended standard construction hours are as follows:

- Mondays to Fridays 7:00 am to 6:00 pm
- Saturdays 8:00 am to 1:00 pm
- Sundays & Public Holidays No work performed

7.4 Construction Minimum Distance Limits

Table 7.2 presents the minimum distances from each construction activity to the nearest receivers that would result in compliance with the 'Noise affected' NMLs. In other words, any receiver that is further from the construction activity than the minimum distance limit specified in Table 7.2 would comply with the relevant 'Noise affected' NML. No receivers are predicted to exceed the 'Highly noise affected' NML.

Note to determine the minimum distance limits a time correction value of -5 dB(A) was applied to the total SWL for each construction activity, as the entire construction fleet would not always operate concurrently.

Table 7.2 – Minimum Distance Limits to Comply with Day NML

| Construction Activity | Day NML, dB(A) | Minimum Distance Limits, m |
|-----------------------|----------------|----------------------------|
| Pipeline Duplication | 40 | 2,391 |
| Road Relocation | 40 | 1,743 |

Review of the extents of construction works in relation to the nearest receivers show that the following receivers are located within the minimum distance limits and may potentially be impacted by construction activities (Table 7.3).

Table 7.3 – Receivers Located Within Minimum Distance Limits

| Construction Activity | Receiver Located Within Minimum Distance Limits | | |
|-----------------------|---|----------|--------------------------------------|
| | ID | Name | Distance to Construction Activity, m |
| Pipeline Duplication | 4 | Goodwood | 1,190 |
| Road Relocation | 21 | Westella | 1,260 |

In light of the potential of noise impacts from construction activities at two privately owned properties, it is recommended that a feasible and reasonable approach towards noise management measures be applied to reduce noise levels as much as possible to manage the impact from construction noise.

Further details on recommended construction noise mitigation and management measures are provided in Section 7.5 below. Construction activities outside of standard hours would only occur on the western side of Lake Cowal and adjacent to the CGO. These areas are sufficiently distant from privately owned receivers to not warrant further assessment.

7.5 Construction Noise Mitigation and Management Measures

The following recommendations provide in-principle feasible and reasonable noise control solutions to reduce noise impacts to sensitive receivers.

The following general noise management measures should be followed:

- Use less noisy plant and equipment, where feasible and reasonable.
- Plant and equipment should be properly maintained.
- Provide special attention to the use and maintenance of 'noise control' or 'silencing' kits fitted to machines to ensure they perform as intended.
- Strategically position plant on site to reduce the emission of noise to the surrounding neighbourhood and to site personnel.
- Avoid any unnecessary noise when carrying out manual operations and when operating plant.
- Any equipment not in use for extended periods should be switched off.
- In addition to the noise mitigation measures outlined above, a management procedure would need to be put in place to deal with noise complaints that may arise from construction activities. Each complaint would need to be investigated and appropriate noise amelioration measures put in place to mitigate future occurrences, where the noise in question is in excess of allowable limits.
- Good relations with people living and working in the vicinity of a construction site should be maintained throughout the Modification. Keeping people informed of progress and taking complaints seriously and dealing with them expeditiously is critical. The person selected to liaise with the community should be adequately trained and experienced in such matters.

Where noise level exceedances cannot be avoided, then consideration may be given to implementing time restrictions and/or providing periods of repose for residents, where feasible and reasonable. That is, daily periods of respite from noisy activities may also be scheduled for building occupants during business hours.

8 Operational Noise Assessment

8.1 Operational Noise Modelling Scenario

The Modification would consist of two distinct production phases and the scenarios selected for operational noise modelling were:

- 2020 – the year of highest combined materials movement (i.e. ore and waste rock) with maximum fleet in operation.
- 2024 – development of the IWL to its maximum height.

8.2 Operational Noise Sources

The SWLs of plant likely to be used during the operation of the Modification have been determined based on manufacturer's specifications, or other available information including Renzo Tonin & Associates database of noise levels and previous studies.

Modifying factor adjustments, as per Section 4 of the INP, have been considered for all proposed plant and equipment. Based on Renzo Tonin & Associates' experience, noise from all sources, individually and in combination were determined not likely to exhibit tonal, low-frequency, impulsive, and/or intermittent characteristics. Therefore, no modifying factors corrections are required.

A summary of plant and equipment included in the noise modelling for the Modification and relevant SWLs, are provided in Table 8.1.

Table 8.1 – Sound Power Levels

| Plant Item | SWL, dB(A) | Quantity | | |
|--|------------|-----------------|------|------|
| | | Modification 13 | 2020 | 2024 |
| Fixed Plant | | | | |
| Process Plant | 124 | 1 | 1 | 1 |

Notes: mm = millimetres.

8.3 Noise Modelling Methodology

Noise emissions from the various plant and processes listed in Table 8.1 were calculated to the nearest and potentially most affected residential receiver locations. Noise emissions were determined by modelling the noise sources, receiver locations, topographical features of the intervening area and recommended noise control treatments, using the Environmental Noise Model (ENM).

Noise levels were calculated at the nearest affected residential locations considering the worst case scenario of all plant operating simultaneously. As a further exercise, the noise levels resulting from adverse meteorological conditions, potentially increasing noise emissions at the nearest residences, were computed using the ENM. These occurrences are expected to be infrequent based on typical weather patterns for the study area.

Where feasible and reasonable, mitigation measures have been introduced to reduce potential noise emissions from the Modification. The iterative steps undertaken are described below:

1. Preliminary noise modelling of scenarios representative of the maximum noise emissions from the Modification to identify the potential for noise exceedances.
2. Evaluation of various combinations of noise management and mitigation measures to assess their relative effectiveness.
3. Review of the effectiveness of these measures and assessment of their feasibility by Evolution.

Steps 1 and 2 above determined that the mobile equipment, in particular the haul truck fleet, are prominent contributors to predicted operational noise levels. Accordingly, the review of the effectiveness of mitigation measures (Step 3) focussed on the SWLs of mobile equipment.

Noise modelling conducted by SLR Consulting (2013) for Modification 11 assessed the effectiveness of:

- noise bunds to shield mobile equipment operating on the waste rock emplacements during adverse weather; and
- locating mobile equipment on the eastern side of the waste rock emplacements (i.e. away from the closest receivers to the west of the CGO) during adverse weather conditions.

The noise modelling indicated that while these measures would reduce noise levels, the predicted reductions during adverse weather conditions were very limited (SLR Consulting, 2013).

SLR Consulting (2013) also assessed the effectiveness of scheduling the TSF lift works during the daytime only. As this was shown to appreciably reduce predicted evening and night-time noise levels at privately-owned receivers, undertaking TSF lift works during the daytime only was incorporated into the predictive modelling for Modifications 11 and 13. This measure has also been incorporated into the predictive modelling for the Modification (for TSF lifts and some aspects of IWL development).

The IWL includes haulage of waste rock to the IWL embankments as a run-of-mine activity during operation of the open pit. Accordingly, haulage of waste rock to the IWL and operation of support fleet at the IWL embankment (e.g. dozer) would be undertaken 24 hours per day (i.e. consistent with open pit operational hours).

The existing CGO mobile equipment fleet would continue to be operated for the Modification.

Evolution has investigated retrofitting the existing haul truck fleet with noise attenuation kits, however the expected capital cost for this is not considered to be reasonable by Evolution, given that the haulage fleet would be progressively decommissioned up until the cessation of open pit mining in approximately 2024, and the limited number of privately-owned receivers predicted to experience exceedances of the relevant criteria. Ongoing operational costs associated with maintaining the effectiveness of the noise attenuation would be additional to this capital cost.

Noise management consisting of treatment measures at privately-owned receivers is proposed, consistent with the existing Development Consent and *Voluntary Land Acquisition and Mitigation Policy* (NSW Government, 2014) (Section 7.5).

8.4 Predicted Operational Noise Levels

Table 8.2 and Table 8.3 below present predicted operational noise levels for 2020 and 2024, respectively, at the nearest potentially affected receivers. Consistent with the previous Modification 13 Noise and Blasting Impact Assessment, a moderate calibration reduction of 3 dB(A) has been incorporated into the noise model and is generally consistent with field measurements and modelling results from similar large scale resource developments. Previous field noise monitoring results conducted by SLR Consulting for the CGO have confirmed the accuracy of the calibration reduction.

Detailed operational noise contours are presented in Appendix B. With regards to noise contours, the calculation involves numerical interpolation from a series of calculations to specific points within a regular spaced grid, 1.5 m above ground level. It is noted that the noise contours are estimates of the predicted noise levels, and the contour values may differ slightly from equivalent calculations at individual residences.

Table 8.2 – Predicted Operational Noise Levels for 2020 at Nearest Affected Receivers (L_{Aeq,15minute})

| Receiver ID | PSNL, dB(A) | | | Predicted Operational Noise Levels, dB(A) | | | |
|----------------------------------|-------------|---------|-------|---|--|-------------------------------|-----------------------------|
| | Day | Evening | Night | Day (8:30 am to 5:00 pm) | Late Afternoon (5:00 pm to 6:00 pm) and Early Morning (7:00 am to 8:30 am) | Evening (6:00 pm to 10:00 pm) | Night (10:00 pm to 7:00 am) |

Notes Predicted noise levels at privately-owned dwellings highlighted in **bold** exceed the PSNLs, while receiver IDs for privately-owned dwellings that previously exceeded the PSNLs are highlighted in *italics*.

1. Evolution has a noise agreement in place with the owner of this property.
2. The owners of these receivers currently have the right to acquisition upon request in Development Consent DA 14/98.

A number of residential receivers were predicted to exceed the PSNL in Table 8.2 and Table 8.3. A summary of the privately-owned receivers with PSNL exceedances during the operational phase are presented in Table 8.4 below.

Table 8.4 – Summary of Properties with PSNL Exceedances

| Property Ownership | 2020 | | | 2024 | | |
|--------------------|---------------------------------------|--|---------------------------------------|---------------------------------------|--|---------------------------------------|
| | Negligible 0-2 dB(A) above PSNL | Marginal to Moderate 3-5 dB(A) above PSNL | Significant >5 dB(A) above PSNL | Negligible 0-2 dB(A) above PSNL | Marginal to Moderate 3-5 dB(A) above PSNL | Significant >5 dB(A) above PSNL |
| Privately-owned | 36 ^{a2} | 21 ¹ , 42 ¹ | - | 22a, 49b | 22c ² | 21 ¹ , 42 ¹ |

Notes: Receiver IDs for privately-owned dwellings that previously exceeded the PSNLs are highlighted in *italics*.

1. The owners of these receivers currently have the right to acquisition upon request in Development Consent DA 14/98.
2. The owners of these receivers currently have the right to additional noise mitigation in Development Consent DA 14/98.

Receivers 22a, 36a and 49b are predicted to experience negligible exceedances above the PSNL and are not considered further as per NSW Government (2014) policy. Noise management measures should be considered for properties that are privately owned with marginal, moderate and significant exceedances above the PSNL. Section 8.5 provides recommended noise management measures for these properties.

8.5 Noise Management Measures

8.5.1 Noise Management Zone

The noise management zone is defined as where properties experience marginal or moderate exceedances of 3-5 dB(A) above the PSNL. The following management measures are recommended for properties in this zone:

- noise monitoring on-site and within the community;
- prompt response to any community issues of concern;
- refinement of on-site noise mitigation measures and operating procedures, where practicable; and
- implementation of reasonable and feasible acoustical mitigation at receivers. Consistent with NSW Government (2014), potential treatment measures would be considered at privately owned receiver 22c including provision of mechanical ventilation/comfort systems (e.g. air conditioning) to enable windows to be closed without compromising internal air quality/amenity (refer to Table 6.6).

8.5.2 Noise Affection Zone

The noise affection zone is defined as where properties experience significant exceedances >5 dB(A) above the PSNL. Consistent with NSW Government (2014), these receivers are afforded acquisition upon request rights. As shown in Table 8.2, only receivers 21 and 42 are predicted to be in the noise affection zone and as discussed in Section 6.2.3, these receivers already have these rights in accordance with the existing Development Consent (DA 14/98).

8.6 Amenity Noise Levels

For privately-owned receivers, the intrusive criteria are more stringent than the amenity criteria during all time periods. Furthermore, cumulative noise assessment is not required due to the absence of any industrial or other mining developments in the vicinity of the Modification (Section 6.2.6) so analysis of amenity noise levels is not required. Therefore the intrusiveness criteria are the controlling criteria for privately-owned receivers and the amenity criteria are not considered further for privately-owned receivers.

The amenity criteria are applicable for the Relocated Crown Reserve, a non-residential receiver. Table 8.5 and Table 8.6 present the predicted noise levels for the Relocated Crown Reserve from the Modification compared to the amenity noise criteria.

Table 8.5 – Predicted Operational Noise Levels for 2020 at Relocated Crown Reserve ($L_{Aeq,Period}$)

| Receiver ID | Amenity Criteria, dB(A) | | | Predicted Operational Noise Levels, dB(A) | | |
|-------------------------|-------------------------|---------|-------|---|-------------------------------|-----------------------------|
| | Day | Evening | Night | Day (7:00 am to 6:00 pm) | Evening (6:00 pm to 10:00 pm) | Night (10:00 pm to 7:00 am) |
| Relocated Crown Reserve | 50 (when in use) | | | 28 | 41 | 42 |

Table 8.6 – Predicted Operational Noise Levels for 2024 at Relocated Crown Reserve ($L_{Aeq,Period}$)

| Receiver ID | Amenity Criteria, dB(A) | | | Predicted Operational Noise Levels, dB(A) | | |
|-------------------------|-------------------------|---------|-------|---|-------------------------------|-----------------------------|
| | Day | Evening | Night | Day (7:00 am to 6:00 pm) | Evening (6:00 pm to 10:00 pm) | Night (10:00 pm to 7:00 am) |
| Relocated Crown Reserve | 50 (when in use) | | | 27 | 39 | 40 |

The Relocated Crown Reserve is predicted to comply with the amenity criteria for both operational years.

8.7 Sleep Disturbance

Consistent with the methodology used in the Modification 11 Noise and Blasting Impact Assessment (SLR Consulting, 2013), the mean difference between the intrusive $L_{Aeq,15minute}$ and the corresponding $L_{A1,1minute}$ noise levels from 6-monthly operator-attended night time noise monitoring results was found to be 7 dB(A).

Based on the mean difference, Table 8.7 presents the predicted night time $L_{A1,1minute}$ noise levels at the nearest affected receivers. The maximum noise level predictions take into account the meteorological assessment conditions nominated in Section 5.1 for night-time and presented values are the maximum over all modelled conditions.

Table 8.7 – Predicted Sleep Disturbance Noise Levels at Nearest Affected Receivers (L_{A1, 1 minute})

| Receiver | Sleep disturbance criteria (10:00 pm - 7:00 am), dB(A) | | Predicted Sleep Disturbance Level L _{A1, 1 minute} , dB(A) | |
|----------------------------------|--|-------------|---|-----------|
| | L _{A90, 15 minute} + 15 | Upper limit | Year 2020 | Year 2024 |

| Receiver | Sleep disturbance criteria (10:00 pm - 7:00 am), dB(A) | | Predicted Sleep Disturbance Level $L_{A1, 1 \text{ minute}}$, dB(A) | |
|----------|--|-------------|--|-----------|
| | $L_{A90, 15 \text{ minute}} + 15$ | Upper limit | Year 2020 | Year 2024 |
| 122 | 45 | 65 | 29 | 27 |
| 126 | 45 | 65 | 22 | 27 |

Notes **Green** denotes exceedance of $L_{A90(15\text{min})} + 15$ screening criterion but within upper limit of 65 dB(A).

1. Evolution has a noise agreement in place with the owner of this property.
2. The owners of these receivers currently have the right to acquisition upon request in Development Consent DA 14/98.

From Table 8.7, receivers 21 and 42 were predicted to exceed the sleep disturbance screening criterion by up to 11 dB(A), but not the sleep disturbance upper limit criterion of 65 dB(A).

Predicted noise levels at all other privately-owned receivers were found to be within both nominated criteria.

It is considered that the mitigation/management measures discussed in Section 8.5 would adequately mitigate the potential sleep disturbance exceedances.

8.8 Twenty-five Percent Land Assessment

As discussed in Section 6.2.5, in NSW Government (2014), voluntary land acquisition rights are conferred on private property owners where there are predicted exceedances of the maximum noise levels of the INP amenity criteria on more than 25% of any privately-owned land. From review of the operational noise contours in Appendix B (incorporating a -3 dB[A] allowance to convert the $L_{Aeq,15\text{minute}}$ contours shown to $L_{Aeq,Period}$), no privately-owned property was found to exceed the INP rural night-time amenity recommended maximum noise levels for greater than 25% of the property's total area.

8.9 Bird Breeding Areas

The predicted results indicate that the maximum intrusive noise level at the closest bird breeding area (Bird Breeding Area South [NO3]) would be 47 dB(A) $L_{Aeq,15\text{minute}}$ (Table 8.2 and Table 8.3). Noise and bird behaviour monitoring is conducted at the CGO, with a focus on abrupt events more likely to affect waterbird behaviour. Results of waterbird behaviour monitoring conducted at the CGO found that there was no abrupt change in the behaviour of any bird species to noise (or other effects) from blasts conducted at the CGO (Trevor Brown and Associates, 2016). Given the proposed continuation of noise and bird behaviour monitoring in accordance with the Flora and Fauna Management Plan (Evolution, 2015), noise emissions from the Modification would be unlikely to significantly impact any fauna species.

9 Other Issues

9.1 Blasting

Blasting produces ground-borne vibration and air blast overpressure, both of which can cause discomfort, and at higher levels, damage to property. The existing CGO Development Consent (DA 14/98) contains blasting impact assessment criteria, as shown in the following extract from Condition 6.3, Schedule 2 of Development Consent DA 14/98.

a) Impact Assessment Criteria

The Applicant shall ensure that blasting on site does not cause any exceedance of the criteria in Table 6.

Table 6: Blasting impact assessment criteria

| Location & Time | Airblast overpressure (dB[Lin Peak]) | Ground vibration (mm/s) | Allowable exceedance |
|---|---|--------------------------------|--|
| <i>Residence on privately-owned land - Any time</i> | <i>120</i> | <i>10</i> | <i>0%</i> |
| <i>Residence on privately-owned land - Monday to Saturday during day</i> | <i>115</i> | <i>5</i> | <i>5% of the total number of blasts over a period of 12 months</i> |
| <i>Residence on privately-owned land - Monday to Saturday during evening</i> | <i>105</i> | <i>2</i> | <i>5% of the total number of blasts over a period of 12 months</i> |
| <i>Residence on privately-owned land - Monday to Saturday at Night, Sundays and Public holidays</i> | <i>95</i> | <i>1</i> | <i>5% of the total number of blasts over a period of 12 months</i> |

Note: mm/s = millimetres per second

Blast parameters and the pit remain the same as what was presented in the Modification 13 Noise and Blasting Impact Assessment (Renzo Tonin & Associates, 2016). Therefore the previous Modification 13 blasting assessment still applies.

For Modification 13, all privately-owned receiver locations were predicted to comply with vibration and blast overpressure criteria. It is noted blast size may be modified (i.e. Maximum Instantaneous Charge may be reduced) should blast monitoring indicate that blast overpressure is approaching the relevant blasting criteria. Blasting is therefore not considered further in this report.

9.2 Road Traffic Noise

9.2.1 Criteria

Noise impact from the potential increase in traffic on the surrounding road network due to construction and operational activities is assessed against the RNP. The RNP sets out criteria to be applied to particular types of road and land uses. These noise criteria are to be applied when assessing noise impact and determining mitigation measures for sensitive receivers that are potentially affected by road traffic noise associated with the construction and operation of the subject site, with the aim of preserving the amenity appropriate to the land use.

Table 9.1 sets out the assessment criteria for residences, to be applied to particular types of projects, road category and land use. These criteria are for assessment against façade corrected noise levels when measured in front of a building façade. The surrounding road network potentially impacted by the Modification traffic consists of roads classified as sub-arterial roads.

In Table 9.1 below and in accordance with the RNP, freeways, arterial roads and sub-arterial roads are grouped together and attract the same criteria.

Table 9.1 – Road Traffic Noise Assessment Criteria for Residential Land Uses

| Road Category | Type of Project/Land Use | Assessment Criteria, dB(A) | |
|---|--|---|--|
| | | Day 7:00 am – 10:00 pm | Night 10:00 pm – 7:00 am |
| Freeway / arterial / sub-arterial roads | Existing residences affected by additional traffic on existing freeways/arterial/sub-arterial roads generated by land use developments | L _{Aeq,(15 hour)} 60 (external) | L _{Aeq,(9 hour)} 55 (external) |

Where existing traffic noise levels are above the noise assessment criteria, the primary objective is to reduce these through feasible and reasonable measures to meet the assessment criteria.

As described in the RNP, in assessing feasible and reasonable mitigation measures, an increase of up to 2 dB represents a minor impact that is considered barely perceptible to the average person.

The RNP also states:

*For existing residences and other sensitive land uses affected by **additional traffic on existing roads generated by land use developments**, any increase in the total traffic noise level should be limited to 2 dB above that of the corresponding 'no build option'.*

This means that any increase in total traffic noise due to a new project, or modification to an existing project, should be limited to 2 dB above the existing total traffic noise levels.

9.2.2 Road Traffic Noise Assessment

A Road Transport Assessment (Appendix H) for the Modification was prepared by GTA Consultants (2018). The Road Transport Assessment identified five road locations for forecasting traffic volumes to determine the impact on the surrounding road network for the years 2020 and 2024. Table 9.2 presents the future day (7:00 am to 10:00 pm) and night (10:00 pm to 7:00 am) total traffic for years 2020 and 2024 without the Modification and years 2020 and 2024 with the Modification. The forecast traffic volumes at the five surrounding road locations include a breakdown of light and heavy vehicles.

Table 9.2 – Traffic Volumes

| Road | Total Traffic (vehicles per day) | | | | | |
|------------------------------------|----------------------------------|-------|-------|----------------------------|-------|-------|
| | Day (7:00 am – 10:00 pm) | | | Night (10:00 pm - 7:00 am) | | |
| | Light | Heavy | Total | Light | Heavy | Total |
| Year 2020 No Modification | | | | | | |
| 1. CGO Access Road | 156 | 84 | 240 | 87 | 21 | 108 |
| 2. Blow Clear Road | 161 | 78 | 239 | 77 | 24 | 101 |
| 3. Wamboyne Road | 78 | 15 | 93 | 4 | 0 | 4 |
| 4. Ungarie Road | 901 | 264 | 1,165 | 123 | 38 | 161 |
| 5. Newell Highway | 1,200 | 698 | 1,898 | 76 | 157 | 233 |
| Year 2024 No Modification | | | | | | |
| 1. CGO Access Road | 156 | 84 | 240 | 87 | 21 | 108 |
| 2. Blow Clear Road | 163 | 79 | 242 | 77 | 24 | 101 |
| 3. Wamboyne Road | 82 | 16 | 98 | 4 | 0 | 4 |
| 4. Ungarie Road | 932 | 270 | 1,202 | 125 | 40 | 165 |
| 5. Newell Highway | 1,245 | 724 | 1,969 | 79 | 164 | 243 |
| Year 2020 With Modification | | | | | | |
| 1. CGO Access Road | 162 | 108 | 270 | 93 | 29 | 122 |
| 2. Blow Clear Road | 165 | 96 | 261 | 81 | 30 | 111 |
| 3. Wamboyne Road | 78 | 15 | 93 | 4 | 0 | 4 |
| 4. Ungarie Road | 905 | 286 | 1,191 | 127 | 44 | 171 |
| 5. Newell Highway | 1,200 | 707 | 1,907 | 76 | 160 | 236 |
| Year 2024 With Modification | | | | | | |
| 1. CGO Access Road | 159 | 175 | 334 | 90 | 24 | 114 |
| 2. Blow Clear Road | 164 | 90 | 254 | 78 | 27 | 105 |
| 3. Wamboyne Road | 82 | 16 | 98 | 4 | 0 | 4 |
| 4. Ungarie Road | 933 | 361 | 1,294 | 126 | 43 | 169 |
| 5. Newell Highway | 1,245 | 729 | 1,974 | 79 | 165 | 244 |

Based on the traffic volumes in Table 9.2, and the nearest distance from each of the five road locations to residential receivers, the predicted traffic noise levels at the worst affected receiver locations are predicted for the years 2020 and 2024 and compared against the no Modification situation in Table 9.3.

If the predicted traffic noise levels at the closest residential receiver meets the proposed criteria then the criteria would be met at all other residential receivers along the same road.

Table 9.3 – Predicted Day $L_{Aeq, 15hour}$ and Night $L_{Aeq, 9hour}$ Traffic Noise Levels

| Road | Distance to Nearest Receiver, m | Day $L_{Aeq, 15hour}$ (dB[A]) (7:00 am – 10:00 pm) | | | Night $L_{Aeq, 9hour}$ (dB[A]) (10:00 pm - 7:00 am) | | |
|--------------------|---------------------------------|---|-----------------|------------|--|-----------------|------------|
| | | With Modification | No Modification | Difference | With Modification | No Modification | Difference |
| Year 2020 | | | | | | | |
| 1. CGO Access Road | 800 | 33 | 32 | 1.0 | 30 | 29 | 1.1 |
| 2. Blow Clear Road | 240 | 41 | 40 | 0.7 | 38 | 37 | 0.8 |
| 3. Wamboyne Road | 69 | 41 | 41 | 0.0 | 26 | 26 | 0.0 |
| 4. Ungarie Road | 36 | 56 | 56 | 0.2 | 50 | 49 | 0.5 |
| 5. Newell Highway | 17 | 61 | 61 | 0.0 | 56 | 56 | 0.1 |
| Year 2024 | | | | | | | |
| 1. CGO Access Road | 800 | 35 | 32 | 2.9 | 29 | 29 | 0.5 |
| 2. Blow Clear Road | 240 | 40 | 40 | 0.5 | 38 | 37 | 0.4 |
| 3. Wamboyne Road | 69 | 41 | 41 | 0.0 | 26 | 26 | 0.0 |
| 4. Ungarie Road | 36 | 57 | 56 | 0.9 | 50 | 50 | 0.2 |
| 5. Newell Highway | 17 | 61 | 61 | 0.0 | 56 | 56 | 0.0 |

From Table 9.3, the daytime $L_{Aeq, 15hour}$ traffic noise levels predicted for receivers along the Newell Highway marginally exceed the RNP $L_{Aeq, 15hour}$ noise criterion of 60 dB(A) for both years 2020 and 2024, however predicted $L_{Aeq, 15hour}$ traffic noise levels with and without the Modification are the same. All other receivers along the other four road locations are within the RNP $L_{Aeq, 15hour}$ noise criterion of 60 dB(A) for both years 2020 and 2024. The 2 dB(A) relative increase criteria is exceeded for receivers near the CGO Access Road in 2024, however predicted $L_{Aeq, 15hour}$ traffic noise levels with the Modification are at least 25 dB(A) below the RNP noise criterion of 60 dB(A).

From Table 9.3, the night-time $L_{Aeq, 9hour}$ traffic noise levels predicted for receivers along the Newell Highway marginally exceed the RNP $L_{Aeq, 9hour}$ noise criterion of 55 dB(A) for both years 2020 and 2024, however predicted $L_{Aeq, 9hour}$ traffic noise levels with and without the Modification are the same. All other receivers along the other four road locations are within the RNP $L_{Aeq, 9hour}$ noise criterion of 55 dB(A) for both years 2020 and 2024. The 2 dB(A) relative increase criteria is not predicted to be exceeded for any receivers.

10 Conclusion

10.1 General

- Gold production commenced at the CGO in 2006, which involves open pit mining operations occurring 24 hours a day, 7 days a week. The Modification would increase the ore processing capacity of the CGO's existing process plant from 7.5 Mtpa to 9.8 Mtpa. The main activities include modifying the existing TSF into an IWL and installation of secondary crushing circuit.
- A background noise survey was conducted prior to the operation of the CGO and the RBLs, determined in accordance INP methodology, were found to be consistent with what is expected of a rural region. Additional background noise monitoring was not considered appropriate for the Modification given the existing operation of the approved CGO. The RBL for day, evening and night periods used in this assessment have adopted the minimum RBL nominated in the INP of 30 dB(A) to allow for a conservative assessment.
- An analysis of noise enhancement from adverse meteorological conditions has previously been conducted in accordance with the INP based upon meteorological data collected at the CGO meteorological station. Wind enhancement was not found to be a feature of the area however temperature inversions were included in the operational noise modelling. Noise modelling for the operational phase was undertaken under a varied set of adverse meteorological conditions.

10.2 Construction Noise

- Construction activities include duplication of a water pipeline and realignment of Lake Cowal Road. These activities would occur during standard hours of construction, with the exception of construction of the water pipeline on the western side of Lake Cowal, which would be undertaken 24 hours per day, 7 days per week.
- Two (2) privately-owned receivers were found to lie within the minimum distance limits to comply with the day time NML.
- In-principle recommendations have been provided to limit the potential impact of noise and vibration generated by construction activities to acceptable levels.

10.3 Operational Noise

- Operational scenarios were considered for 2020 and 2024, coinciding with the year of highest combined materials movement with maximum fleet in operation and development of the IWL to its maximum height, respectively.
- Four (4) privately-owned receivers are predicted to experience negligible exceedances of the PSNL. One (1) privately-owned receiver is predicted to experience moderate exceedances of the PSNL. Two (2) privately-owned receivers are predicted to experience significant exceedances of the PSNL (the owners of both receivers currently have the right to acquisition upon request in Development Consent DA 14/98).
- Recommendations for noise management measures for operational noise at the receiver locations exceeding the PSNLs have been provided, including provision of mechanical ventilation/comfort systems (e.g. air conditioning) to enable windows to be closed without compromising internal air quality/amenity.
- All privately-owned receivers are predicted to experience night-time $L_{A1,1\text{minute}}$ noise within the sleep disturbance screening criterion and the upper limit of the sleep disturbance criterion. Exceedances of the EPA's sleep disturbance screening criteria are predicted at two properties, however these receivers are currently afforded acquisition upon request rights.
- Review of the predicted noise contours over privately-owned land (25% of land assessment) as required by the NSW Government's (2014) *Voluntary Land Acquisition and Management Policy* indicates that no privately-owned property would exceed the INP amenity maximum noise level criteria for greater than 25% of the property's total area.

10.4 Road Traffic Noise

- Road traffic noise was assessed for the years 2020 and 2024, and five road locations representative of the surrounding road network, as determined by the Road Transport Assessment for the Modification (GTA Consultants, 2018).
- Predicted road traffic noise at all locations for all periods were found to comply with the RNP criteria.

APPENDIX A Glossary of Terminology

The following is a brief description of the technical terms used to describe noise to assist in understanding the technical issues presented.

| | |
|--------------------|---|
| Adverse weather | Weather effects that enhance noise (that is, wind and temperature inversions) that occur at a site for a significant period of time (that is, wind occurring more than 30% of the time in any assessment period in any season and/or temperature inversions occurring more than 30% of the nights in winter). |
| Ambient noise | The all-encompassing noise associated within a given environment at a given time, usually composed of sound from all sources near and far. |
| Assessment period | The period in a day over which assessments are made. |
| Assessment point | A point at which noise measurements are taken or estimated. A point at which noise measurements are taken or estimated. |
| Background noise | Background noise is the term used to describe the underlying level of noise present in the ambient noise, measured in the absence of the noise under investigation, when extraneous noise is removed. It is described as the average of the minimum noise levels measured on a sound level meter and is measured statistically as the A-weighted noise level exceeded for ninety percent of a sample period. This is represented as the L ₉₀ noise level (see below). |
| Decibel [dB] | The units that sound is measured in. The following are examples of the decibel readings of every day sounds: 0 dB The faintest sound we can hear 30 dB A quiet library or in a quiet location in the country 45 dB Typical office space. Ambience in the city at night 60 dB CBD mall at lunch time 70 dB The sound of a car passing on the street 80 dB Loud music played at home 90 dB The sound of a truck passing on the street 100 dB The sound of a rock band 110 dB Operating a chainsaw or jackhammer 120 dB Deafening |
| dB(A) | A-weighted decibels. The A-weighting noise filter simulates the response of the human ear at relatively low levels, where the ear is not as effective in hearing low frequency sounds as it is in hearing high frequency sounds. That is, low frequency sounds of the same dB level are not heard as loud as high frequency sounds. The sound level meter replicates the human response of the ear by using an electronic filter which is called the "A" filter. A sound level measured with this filter switched on is denoted as dB(A). Practically all noise is measured using the A filter. |
| Frequency | Frequency is synonymous to pitch. Sounds have a pitch which is peculiar to the nature of the sound generator. For example, the sound of a tiny bell has a high pitch and the sound of a bass drum has a low pitch. Frequency or pitch can be measured on a scale in units of Hertz or Hz. |
| Impulsive noise | Having a high peak of short duration or a sequence of such peaks. A sequence of impulses in rapid succession is termed repetitive impulsive noise. |
| Intermittent noise | The level suddenly drops to that of the background noise several times during the period of observation. The time during which the noise remains at levels different from that of the ambient is one second or more. |
| L _{Max} | The maximum sound pressure level measured over a given period. |
| L _{Min} | The minimum sound pressure level measured over a given period. |
| L ₁ | The sound pressure level that is exceeded for 1% of the time for which the given sound is measured. |
| L ₁₀ | The sound pressure level that is exceeded for 10% of the time for which the given sound is measured. |

| | |
|----------------------|---|
| L ₉₀ | The level of noise exceeded for 90% of the time. The bottom 10% of the sample is the L90 noise level expressed in units of dB(A). |
| L _{eq} | The "equivalent noise level" is the summation of noise events and integrated over a selected period of time. |
| Reflection | Sound wave changed in direction of propagation due to a solid object obscuring its path. |
| Sound | A fluctuation of air pressure which is propagated as a wave through air. |
| Sound absorption | The ability of a material to absorb sound energy through its conversion into thermal energy. |
| Sound level meter | An instrument consisting of a microphone, amplifier and indicating device, having a declared performance and designed to measure sound pressure levels. |
| Sound pressure level | The level of noise, usually expressed in decibels, as measured by a standard sound level meter with a microphone. |
| Sound power level | Ten times the logarithm to the base 10 of the ratio of the sound power of the source to the reference sound power. |
| Tonal noise | Containing a prominent frequency and characterised by a definite pitch. |
